Contents

1 Introduction

This manual explains the SunSpec protocol using Modbus for SOLECTRIA XGI 1500 inverters. This does not include the history of either SunSpec or Modbus or the details regarding the creation of the protocols. It is expected that the person(s) reading this manual have a clear understanding of both SunSpec and Modbus.

1.1 SunSpec Overview

SunSpec organizes all registers into defined groups called models. Each model begins with a header to identify it and its length. Only the models listed in this document are supported by SOLECTRIA XGI 1500 inverters. See Section 2.3 for the list of supported models.

Within each model, not all registers are supported. Unsupported registered are marked as “Reserved”. Only use supported registers.

1.2 Data Types

Several data types are used in this document.

- **acc32:** An accumulated value that fills two registers. This is used for a value that increases over time.
- **bitfield16:** Group of 16 individual bits that fills one register. This is used to select non-mutually exclusive options, such as alarms.
- **bitfield32:** Group of 32 individual bits that fills two registers. This is used to select non-mutually exclusive options, such as alarms.
- **enum16:** Enumerated type that fills one register. This is used to select mutually exclusive options, such as the state of the inverter.
- **float32:** Floating point number that fills two registers.
- **int16:** Signed integer that fills one register.
- **string:** Group of registers that are used to hold an alphanumeric value. Size depends on the string and must be read for each string.
- **sunssf:** SunSpec scale factor.
- **uint16:** Unsigned integer that fills one register.
- **uint32:** Unsigned integer that fills two registers.
- **uint64:** Unsigned integer that fills four registers.

2 Modbus Overview

Registers can be read using Modbus function code three (3) and certain registers can be written with Modbus function code six (6). When reading or writing to a group of registers, such as reading a string, make sure that the read command starts at the lowest address of the group and is of the appropriate length size for the group.

2.1 Value, Scale Factor, and Units

Many registers use a scale factor to communicate the value as an integer. The scale factor and units explain how the value is read. See Equation 2.1 as an example of how to interpret the result of reading Address 40075, as shown in Table 2.1.

Table 2.1 Example of Value, Scale Factor, and Units

Address	Size	Name	Value	Type	Units	Scale factor	R/W	Description
40075	1	AphC	-	uint16	A	A_SF	R	Phase C AC current
40076	1	A_SF	-1	uint16	-	-	R	Scale factor - AC current

Equation 2.1 Example of Applying Value, Scale Factor, and Units

$$Phase\ C\ AC\ Current = Value\ (Address\ 40075) * 10^{-1}\ A$$

2.2 Read/Write

The R/W column determines whether a value is read-only (R), write-only (W), or read-write (RW). Only write to W or RW registers.

The response time for a Modbus command is ≤ 10mS.

2.3 Model Overview

Table 2.2 SunSpec Model Overview

Address	Size	Name	Value	Type	R/W	Description
40000	2	SunSpecID	SunS	string	R	SunSpec ID
40002	68	1	-	-	-	Model 1 - Common
40070	52	103	-	-	-	Model 103 - Inverter (3 Phase)
40122	72	113	-	-	-	Model 113 - Inverter (3 Phase) FLOAT
40184	28	120	-	-	-	Model 120 - Nameplate
40212	32	121	-	-	-	Model 123 - Basic settings
40244	46	122	-	-	-	Model 123 - Measurement Status
40290	26	123	-	-	-	Model 123 - Immediate Controls
40316	62	129	-	-	-	Model 129 - LVRTD
40378	62	130	-	-	-	Model 130 - HVRTD
40440	62	135	-	-	-	Model 135 - LFRT

40502	62	136	-	-	-	Model 136 - HFRT
40654	54	16	-	-	-	Model 16 - Simple IP Network 0 (eth1)
40708	54	16001	-	-	-	Model 16001 - Simple IP Network 1 (eth2)
40762	54	16002	-	-	-	Model 16002 - Simple IP Network 2 (Bridge)
40816	54	16003	-	-	-	Model 16003 - Simple IP Network 3 (WiFi API)
40870	51	64190	-	-	-	Model 64190 - Solectria Variables
40921	1	SunSpecEnd	0xFFFF	-	R	SunSpec End

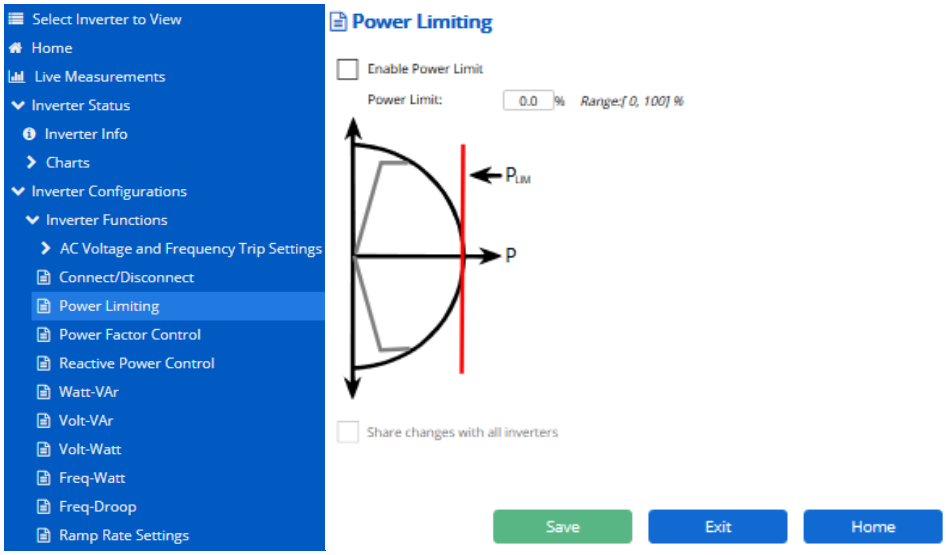
For more information on the models see Section 17.

3 XGI1500 Smart Grid Features

The XGI1500 firmware provides several grid support features to help maintain grid stability and reliability. These features can either be activated, deactivated or updated via web-based GUI or using software which supports Modbus TCP/IP.

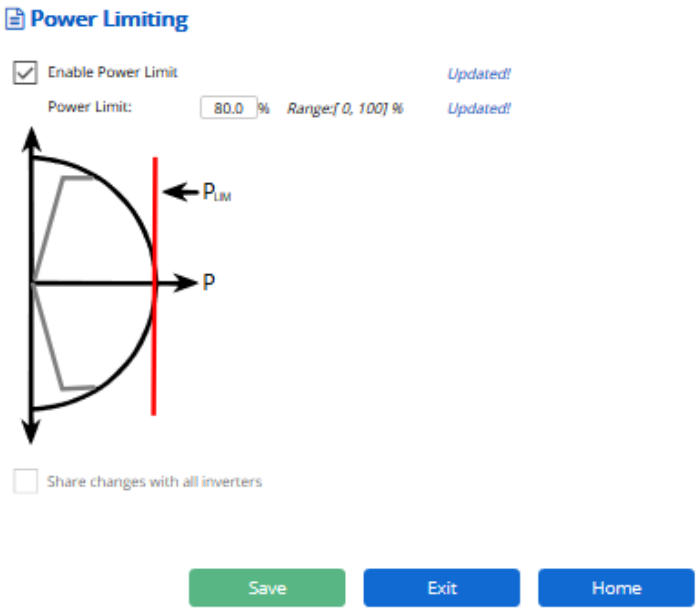
4 Power Limiting

This feature allows the inverter to reduce the output from what it could produce given available resources. Power limiting request typically occurs because of transmission congestion or lack of transmission access. It can also occur due to excess generation during low load periods. The image below shows the default setting of Power Limiting. The default state of this feature is deactivated.



Example:

If the cutomer wants to enable this feature and run the inverter at 80% of rated power. The procedure via the web-based GUI is shown below.



- Write " 80.0 " to Power Limit
- Click the little box on the top left corner of the configuration window to enable Power Limiting
- Click "Save" button to apply the settings to local inverter

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

Register	Sunspec Model DID	Sunspec Offset	Name	Description	Unit	Min	Max	Default Value
40295	123	5	SSPEC_123_WMAXLIMPCT	Real Power Limit - Percentage	%Wmax	0	1000	0
40299	123	9	SSPEC_123_WMAXLIM_ENA	Throttle enable/disable control for power limit		0	1	0

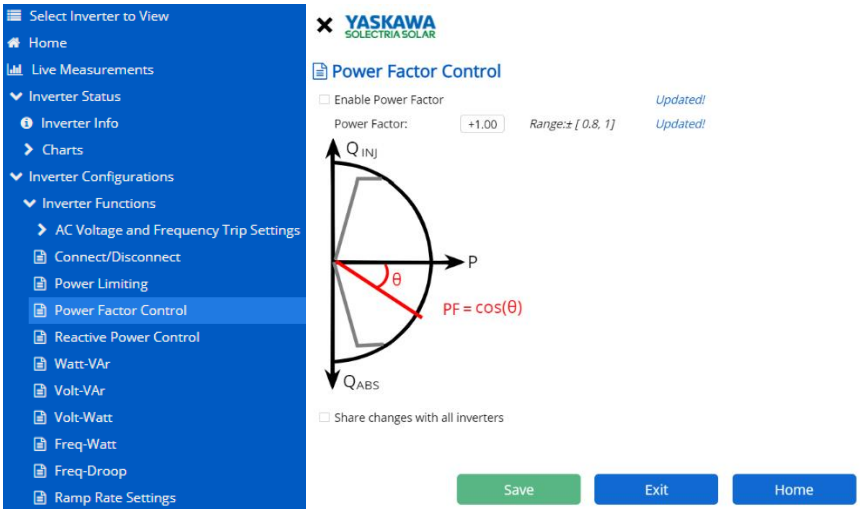
To implement the same setting, the procedure is shown below.

- Write " 800 " to register 40295
- Write " 1 " to register 40299

5 Power Factor Control

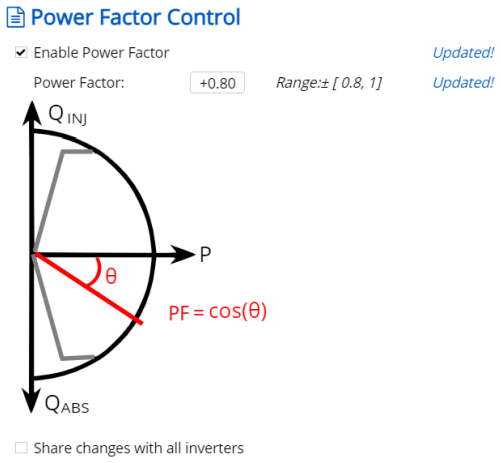
This feature allows inverter to control the power factor at the point of DER connection (PoC). This can maintain the power quality and stability of the overall electrical system. A power factor adjustment gives the utility greater flexibility to supply the power quality required by the loads.

The image below shows the default setting of the Power Factor Control. The default state of this feature is deactivated.



Example:

If the cutomer wants to enable this feature and set the PF to +0.8. The procedure via the web-based GUI is shown below.



- Write " +0.8 " to Power Factor
- Click the little box on the top left corner of the configuration window to enable Power Factor
- Click "Save" button to apply the setting to local inverter

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

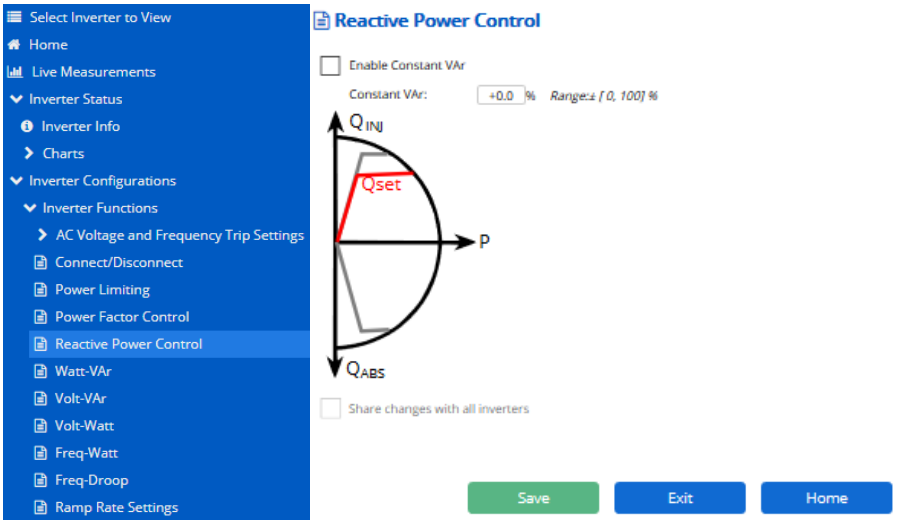
Register	Sunspec Model DID	Sunspec Offset	Name	Description	Unit	Min	Max	Default Value
40300	123	10	SSPEC_123_OUTPFSET	Set power factor to specific value	cos()	80	100	100
40304	123	14	SSPEC_123_OUTPFSET_ENA	Fixed power factor enable/disable control		0	1	0

To implement the same setting, the procedure is shown below.

- Write “ 80 “ to register 40300
- Write “ 1 “ to register 40304

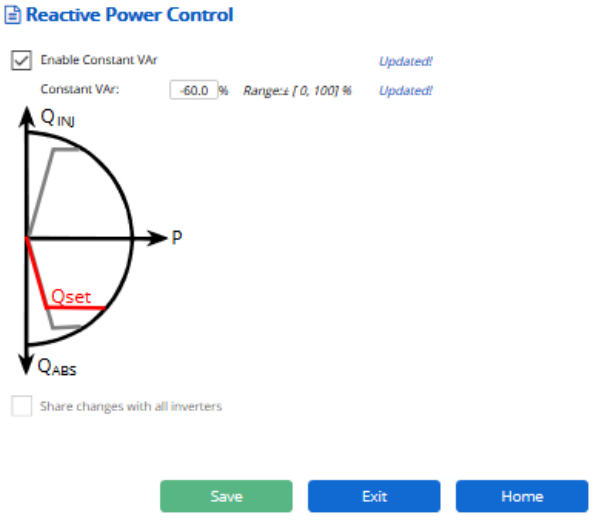
6 Reactive Power Control

The feature allows inverter to stabilize the grid by compensating the reactive power by injecting/absorbing constant VArs. The image below shows the default setting of Reactive Power Control. The default state of this feature is deactivated.



Example:

If the cutomer wants to enable this feature and set the inverter to run at 60% of maximum reactive power capability. The procedure via the web-based GUI is shown below.



- Write “ -60 ” to Constant Var
- Click the little box on the top left corner of the configuration window to enable Reactive Power Control
- Click Save button to apply the settings to local inverter

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

Register	Sunspec Model DID	Sunspec Offset	Name	Description	Unit	Min	Max	Default Value
40306	123	16	SSPEC_123_VARMAXPCT	Reactive power in percent of VArMax	% VArMax	-1000	1000	0
40312	123	22	SSPEC_123_VARPCT_ENA	Percent limit VAr enable/disable control		0	1	0

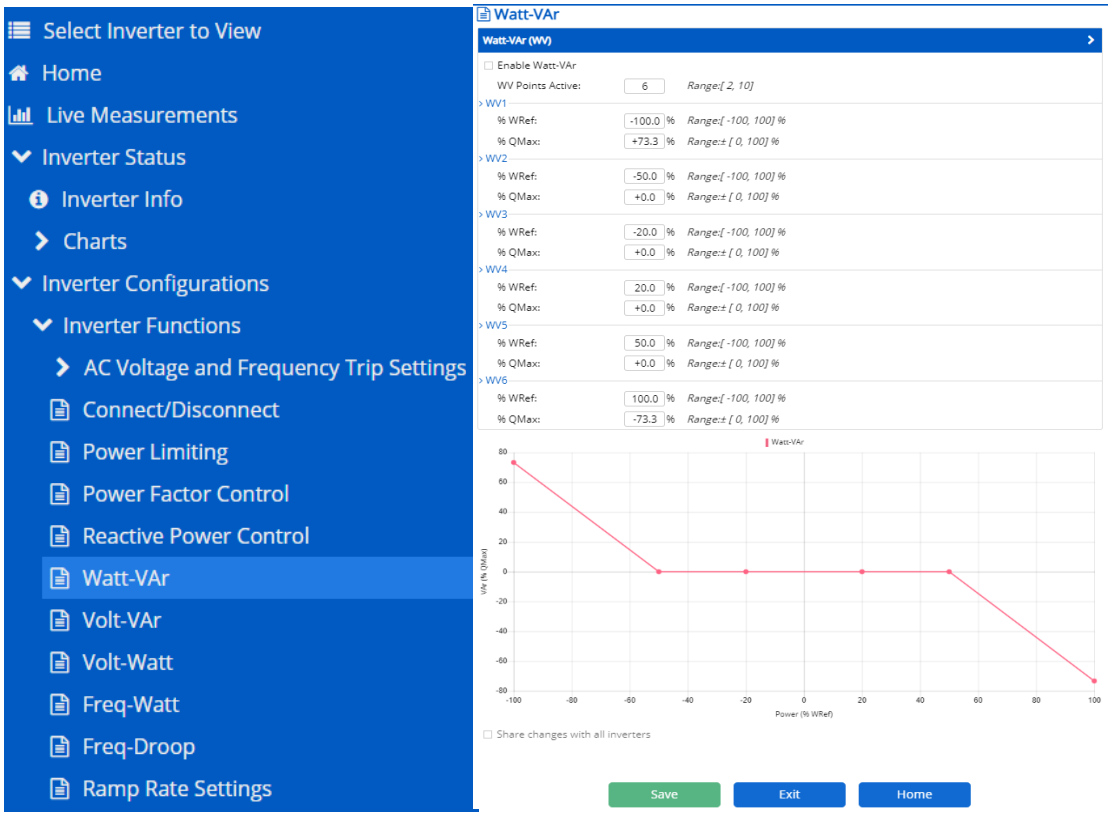
To implement the same settings, the procedure is shown below.

- Write “ -600 “ to register 40306
- Write “ 1 “ to register 40312

7 Watt-Var Control

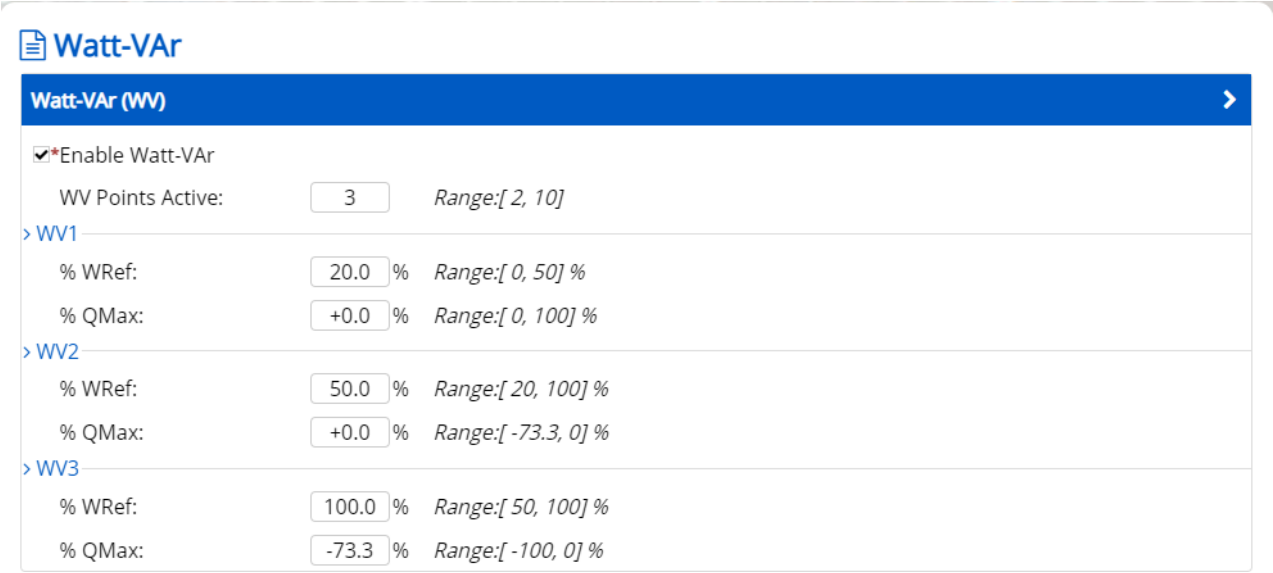
This feature allows the inverter to regulate reactive power as a function of its active power. A power curve must be defined to use this feature.

The image below shows an example. However, the default state of this feature is deactivated.



Example:

To use this feature we need to check the (Enable Watt-Var) Box first to enable the Watt-Var control. After that we need to establish how many points are we adding to this power curve and finally, add the Wattage refrence percantage %Wref and the assosiated reactive power value %QMax. The procedure via the web-based GUI is shown below.



- Enable Watt-VAr(WV) by clicking the little box on the top left corner of the configuration window.
- Define How many points are required on the Power curve. For the Example above Write " 3 " to WV Points Active.
- Write " 20 " to WV1 %WRef.
- Write " 0 " to WV1 %QMax.
- Write " 50 " to WV2 %WRef.
- Write " 0 " to WV2 %QMax.
- Write " 100 " to WV3 %WRef.
- Write " -73.3 " to WV3 %QMax.
- Click Save button to apply the settings to local inverter

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

Register	Sunpec Model DID	Size	Name	Description	Unit	Min	Max	Default Value
42257	712 - DER Watt Var	1	ENA	WattVar - Enable function		0	1	0
42258	712 - DER Watt Var	1	ADOPT_CRV_REQ	Watt Var Active Curve Request		0	10	0
42297	712 - DER Watt Var	1	W_1	Watt Var - Watt 1	%Wref	0	100	0
42298	712 - DER Watt Var	1	VAR_1	Watt Var - Var 1	%Var	0	100	0
42299	712 - DER Watt Var	1	W_2	Watt Var - Watt 2	%Wref	0	100	0
42300	712 - DER Watt Var	1	VAR_2	Watt Var - Var 2	%Var	0	100	0
42301	712 - DER Watt Var	1	W_3	Watt Var - Watt 3	%Wref	0	100	0
42302	712 - DER Watt Var	1	VAR_3	Watt Var - Var 3	%Var	0	100	0

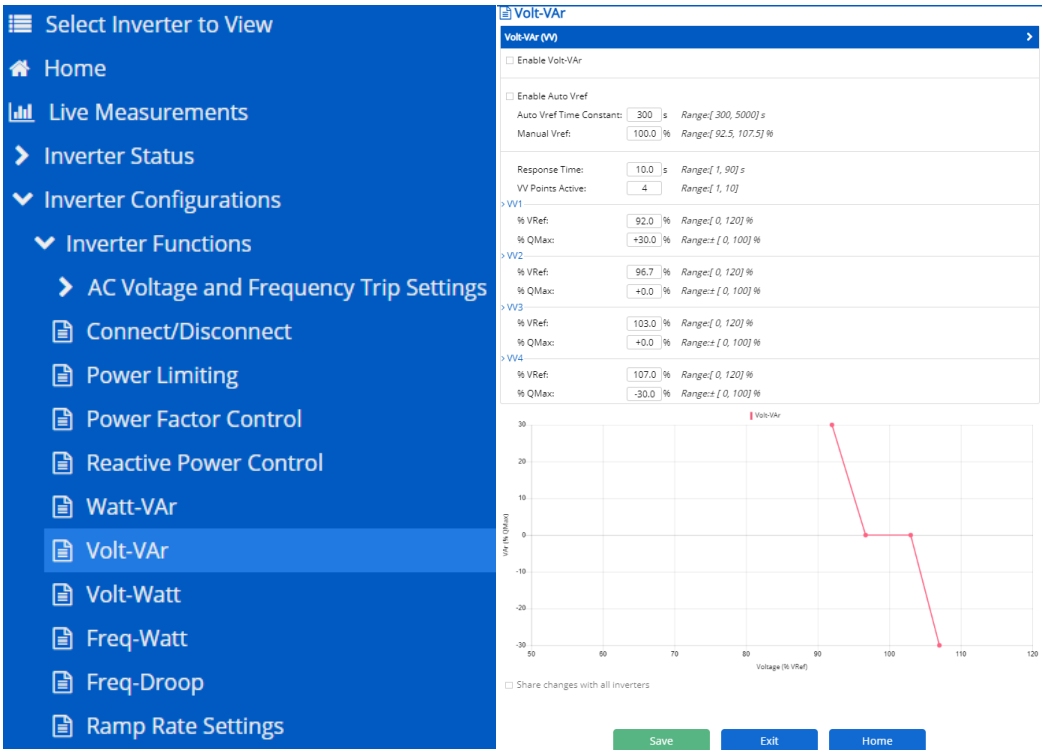
To implement the same settings, the procedure is shown below.

- Write “ 1 “ to register 42257
- Write “ 3 “ to register 42258
- Write “ 20 “ to register 42297
- Write “ 0 “ to register 42298
- Write “ 50 “ to register 42299
- Write “ 0 “ to register 42300
- Write “ 100 “ to register 42300
- Write “ -73.3 “ to register 42300

8 Volt-Var Control

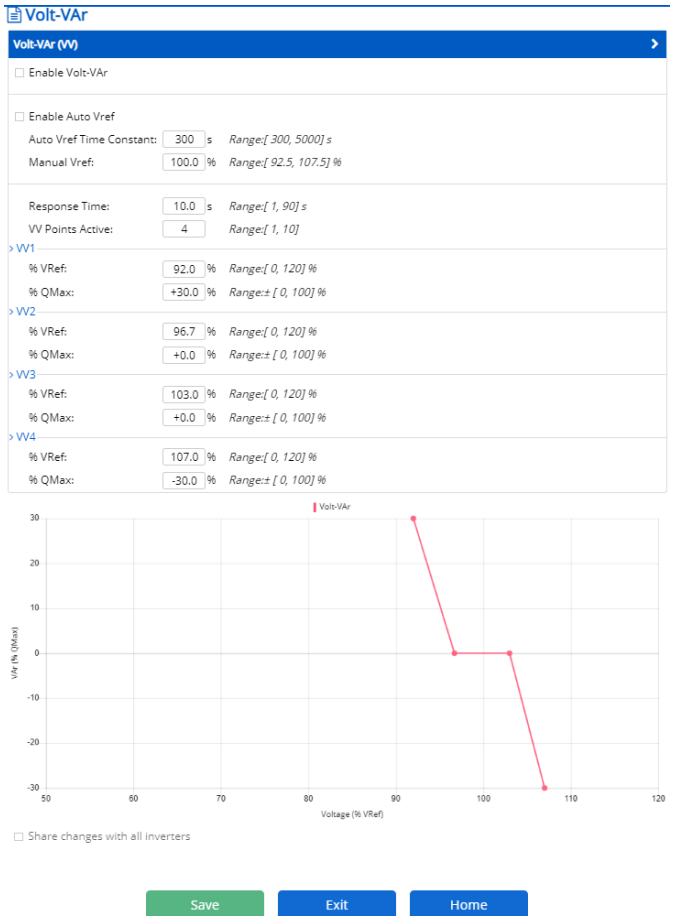
This feature allows the inverter to supply or absorb reactive power as a function of voltage, in order to maintain a stable grid voltage. A curve must be defined to use this feature.

The image below shows the default setting of Volt-Var Control. The default state of this feature is deactivated. The Enable Auto Vref automatically adjusts the nominal voltage reference based on current grid voltage condition in intervals of the Auto Vref Time Constant. When Auto Vref is not enabled, the Manual Vref will be used as the reference.



Example:

If the cutomer wants to enable this feature. The procedure via the web-based GUI is shown below.



- Write “ 300 “ to Auto Vref Time Constant
- Write “ 100 “ to Manual Vref
- Write “10” to Response Time
- Write “ 4 “ to VV Points Active
- Write “ 90.0” to VV1 %Voltage Ref
- Write “ +30.0 to VV1 %QMax
- Write “ 95.0” to VV2 %Voltage Ref
- Write “ +0.0 to VV2 %QMax
- Write “ 105.0” to VV3 %Voltage Ref
- Write “ +0.0 to VV3 %QMax
- Write “ 110.0” to VV4 %Voltage Ref
- Write “ -30.0 to VV4 %QMax
- Click the little box on the top left corner of the configuration window to enable Volt-Var
- Click the little box on the top left corner of the configuration window to enable Enable Auto Vref
- Click Save button to apply the settings to local inverter

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

Address		SunSpec Model	Name	Description	Type	Units	R/W	Setting Range (unscaled)	Default Value (unscaled)
41605	A285	705 - DER Volt-Var	VREF_ADJUST	Manual Volt Var - Vref adjustment as percentage of nominal voltage.	uint16	Pct	RW	0-10000	
41606	A286	705 - DER Volt-Var	VREF_AUTO	(Read-Only) Autonomous vref value as a % of nominal voltage.	uint16		RW		
41607	A287	705 - DER Volt-Var	VREF_AUTO_ENA	Volt Var - Enable autonomous vref.	enum16		RW	0, 1	0

40951	9FF7	126 - Static Volt-VAR	VAr5	Point 5 VARs	int16	-	RW	0-1000	-300
40952	9FF8	126 - Static Volt-VAR	V6	Point 6 Volts	uint16	% Vref	RW	0-1200	1070
40953	9FF9	126 - Static Volt-VAR	VAr6	Point 6 VARs	int16	-	RW	0-1000	-300
40954	9FFA	126 - Static Volt-VAR	V7	Point 7 Volts	uint16	% Vref	RW	0-1200	1070
40955	9FFB	126 - Static Volt-VAR	VAr7	Point 7 VARs	int16	-	RW	0-1000	-300
40956	9FFC	126 - Static Volt-VAR	V8	Point 8 Volts	uint16	% Vref	RW	0-1200	1070
40957	9FFD	126 - Static Volt-VAR	VAr8	Point 8 VARs	int16	-	RW	0-1000	-300
40958	9FFE	126 - Static Volt-VAR	V9	Point 9 Volts	uint16	% Vref	RW	0-1200	1070
40959	9FFF	126 - Static Volt-VAR	VAr9	Point 9 VARs	int16	-	RW	0-1000	-300
40960	A000	126 - Static Volt-VAR	V10	Point 10 Volts	uint16	% Vref	RW	0-1200	1070
40961	A001	126 - Static Volt-VAR	VAr10	Point 10 VARs	int16	-	RW	0-1000	-300

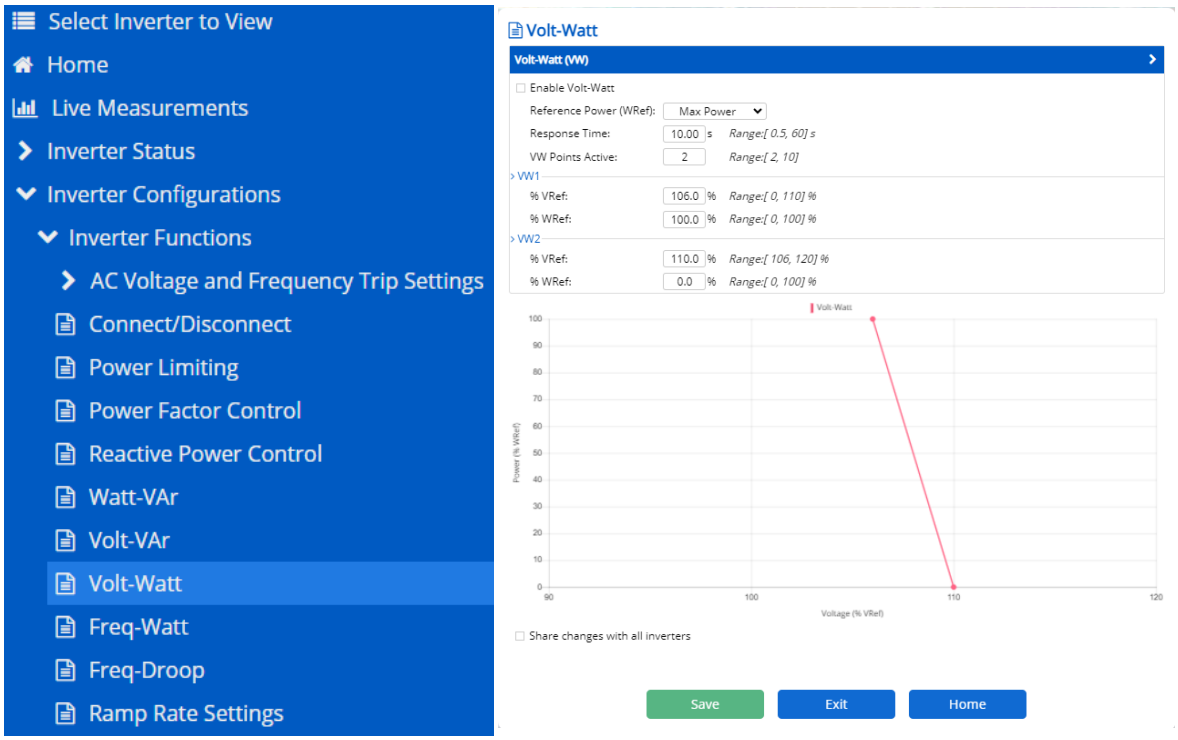
To implement the same curve, the procedure is shown below.

- Write “ 300 ” to register 41608
- Write “ 100 ” to register 41605
- Write “ 10 “ to register 41609
- Write “ 4 “ to register 40940
- Write “ 900” to register 40942
- Write “ 300 to register 40943
- Write “ 950” to register 40944
- Write “ 0 to register 40945
- Write “ 1050” to register 40946
- Write “ 0 to to register 40947
- Write “ 1100” to register 40948
- Write “ -300 to register 40949
- Write “1” to register 40931 to enable Volt-Var Control
- Write “1” to register 41607 to enable Auto Vref

9 Volt-Watt Control

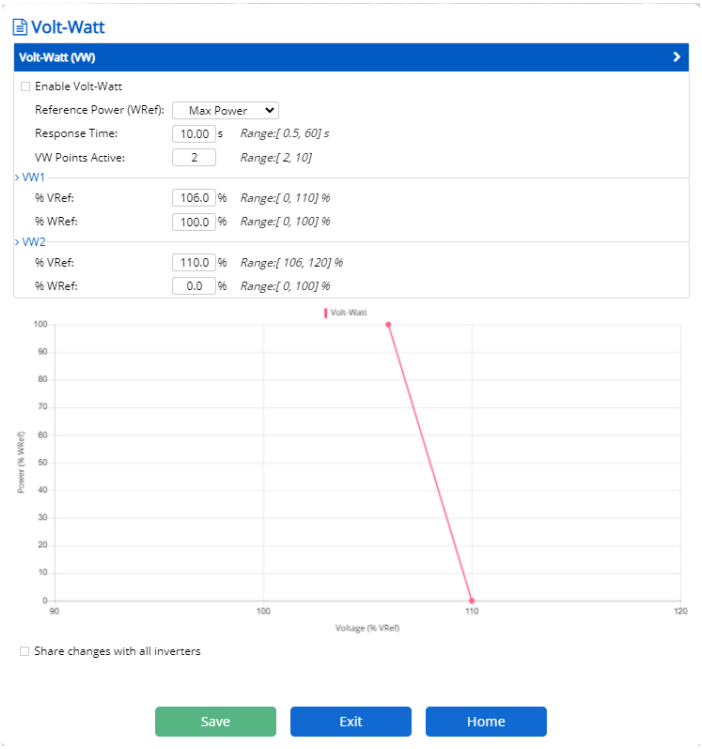
This feature helps to support the grid voltage by changing the inverters active power output as the grid voltage fluctuates. A curve must be defined to use this feature.

The image below shows the default setting of Volt-Vatt Control. The default state of this feature is deactivated.



Example:

If the cutomer wants to enable this feature. The procedure via the web-based GUI is shown below.



- Under Reference Power(WRef) select “Max Power”
- Write “ 10 ” to Response Time
- Write “ 4 ” to VW Points Active
- Write “ 102.0 ” to VW1 Voltage Ref
- Write “ 100.0 ” to VW1 Max Power
- Write “ 105.0 ” to VW2 Voltage Ref
- Write “ 90.0 ” to VW2 Max Power
- Write “ 108.0 ” to VW3 Voltage Ref
- Write “ 50.0 ” to VW3 Max Power
- Write “ 110.0 ” to VW4 Voltage Ref
- Write “ 0.0 ” to VW4 Max Power
- Click the little box on the top left corner of the configuration window to enable Volt Watt Control
- Click Save button to apply the settings to local inverter

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

Address		SunSpec Model	Name	Description	Type	Units	R/W	Setting Range (unscaled)	Default Value (unscaled)
41002	A02A	132 - Volt-Watt	NPt	Number of points in array	uint16	-	R	-	10
40997	A025	132 - Volt-Watt	ModEna	Is Volt-Watt control active Bit0 : Enabled	bitfield16	-	RW	0-1	0
41006	A02E	132 - Volt-Watt	ActPt	Number of active points in array	uint16	-	RW	2-10	2

41008	A030	132 - Volt-Watt	V1	Point 1 Volts	uint16	% Vref	RW	0-1200	1060
41009	A031	132 - Volt-Watt	W1	Point 1 Watts	int16	-	RW	0-1000	1000
41010	A032	132 - Volt-Watt	V2	Point 2 Volts	uint16	% Vref	RW	0-1200	1100
41011	A033	132 - Volt-Watt	W2	Point 2 Watts	int16	-	RW	0-1000	0
41012	A034	132 - Volt-Watt	V3	Point 3 Volts	uint16	% Vref	RW	0-1200	1100
41013	A035	132 - Volt-Watt	W3	Point 3 Watts	int16	-	RW	0-1000	0
41014	A036	132 - Volt-Watt	V4	Point 4 Volts	uint16	% Vref	RW	0-1200	1100
41015	A037	132 - Volt-Watt	W4	Point 4 Watts	int16	-	RW	0-1000	0
41016	A038	132 - Volt-Watt	V5	Point 5 Volts	uint16	% Vref	RW	0-1200	1100
41017	A039	132 - Volt-Watt	W5	Point 5 Watts	int16	-	RW	0-1000	0
41018	A03A	132 - Volt-Watt	V6	Point 6 Volts	uint16	% Vref	RW	0-1200	1100
41019	A03B	132 - Volt-Watt	W6	Point 6 Watts	int16	-	RW	0-1000	0
41020	A03C	132 - Volt-Watt	V7	Point 7 Volts	uint16	% Vref	RW	0-1200	1100
41021	A03D	132 - Volt-Watt	W7	Point 7 Watts	int16	-	RW	0-1000	0
41022	A03E	132 - Volt-Watt	V8	Point 8 Volts	uint16	% Vref	RW	0-1200	1100
41023	A03F	132 - Volt-Watt	W8	Point 8 Watts	int16	-	RW	0-1000	0
41024	A040	132 - Volt-Watt	V9	Point 9 Volts	uint16	% Vref	RW	0-1200	1100
41025	A041	132 - Volt-Watt	W9	Point 9 Watts	int16	-	RW	0-1000	0
41026	A042	132 - Volt-Watt	V10	Point 10 Volts	uint16	% Vref	RW	0-1200	1100
41027	A043	132 - Volt-Watt	W10	Point 10 Watts	int16	-	RW	0-1000	0

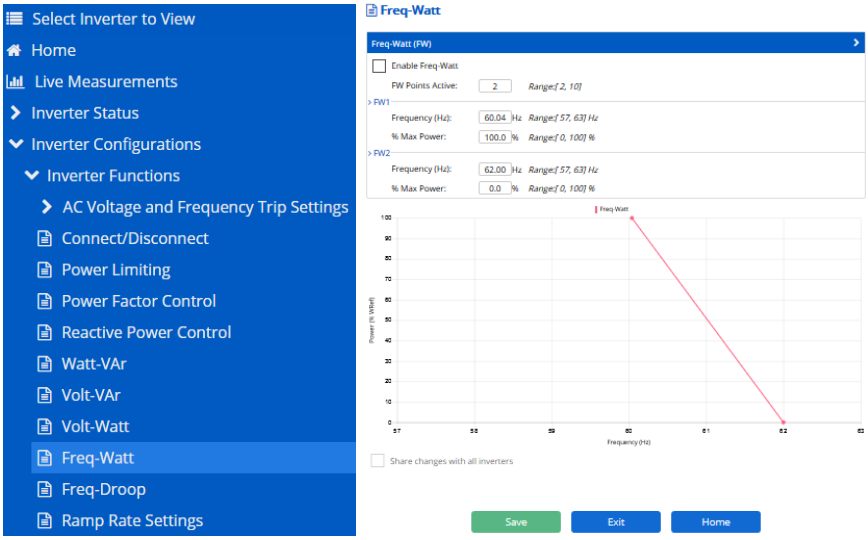
To implement the same curve, the procedure is shown below.

- Write “ 1 ” to register 41673
- Write “ 10 ” to register 41657
- Write “ 4 “ to register 41006 (points 5-10 are ignored)
- Write “ 1020” to register 41008
- Write “ 1000 to register 41009
- Write “ 1050” to register 41010
- Write “ 900” to register 41011
- Write “ 1080” to register 41012
- Write “ 500” to to register 41013
- Write “ 1100” to register 41014
- Write “ 0 ” to register 41015
- Write “1” to register 40997 to enable Volt-Watt control

10 Frequency-Watt Control

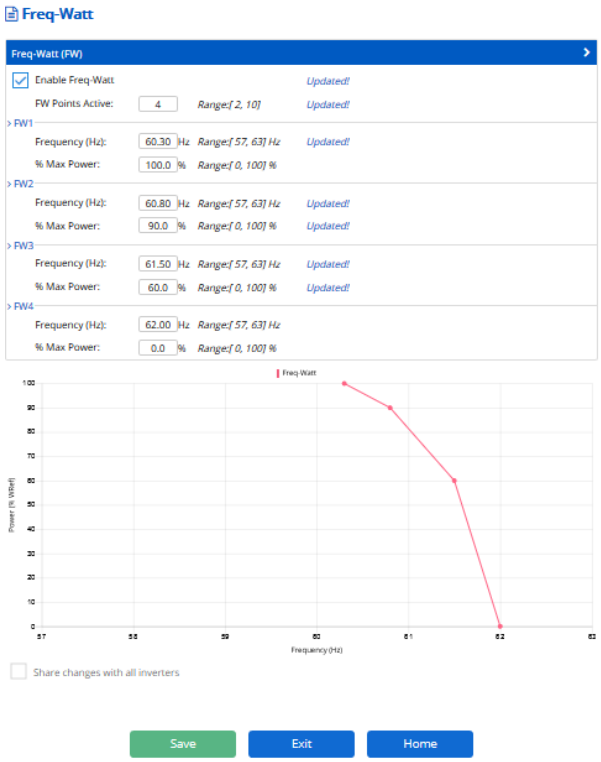
This function helps to change inverter active power output with fluctuations in grid frequency. This will provide frequency support to the electric grid. As frequency increases, the desired response of the inverter is to decrease active power output. A minimum of 2 points is required with the ability to enter up to 10 active points.

The image below shows the default setting of Freq-Watt Control. The default state of this function is deactivated.



Example:

If the cutomer wants to enable this funtion. The procedure via the web-based GUI is shown below.



- Write “ 4 ” to FW Points Active
- Write “ 60.30 ” to Frequency
- Write “ 100.0 ” to % Max Power
- Write “ 60.80 ” to Frequency
- Write “ 90.0 ” to % Max Power
- Write “ 61.50 ” to Frequency
- Write “ 60.0 ” to % Max Power
- Write “ 62.00 ” to Frequency
- Write “ 0.0 ” to % Max Power
- Click the little box on the top left corner of the configuration window to enable Freqency-Watt Control
- Click Save button to apply the settings to local inverter

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

Register	Sunspec Model DID	Sunspec Offset	Name	Description	Unit	Min	Max	Default Value
41068	134	8	SSPEC_134_NPT	FreqWatt - Max Curve Points		10	10	10
41063	134	3	SSPEC_134_MODENA	FreqWatt - Enable Flag		0	1	0

41092	134	32	SSPEC_134_W10	FreqWatt - Watts 10	%Wref	0	1000	0

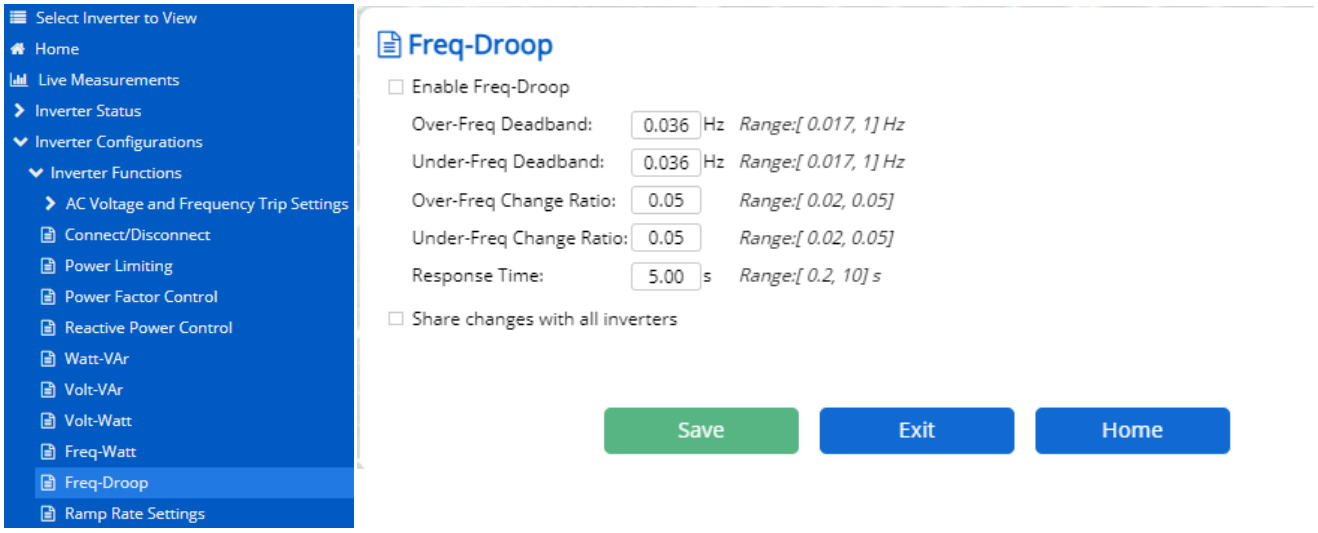
To implement the same curve, the procedure is shown below.

- Write " 4 " to register 41072 (points 5-10 are ignored)
- Write " 6030" to register 41073
- Write " 1000 to register 41074
- Write " 6080" to register 41075
- Write " 900" to register 41076
- Write " 6150" to register 41077
- Write " 600" to to register 41078
- Write " 6200" to register 41079
- Write " 0 " to register 41080
- Write "1" to register 40963 to enable Freq-Watt Control

11 Freq-droop

This function set up the deadband values for both over and under frequencies, very similar to the Freq-Watt function. If enabled, this will take priority over the Freq-Watt Control. These values will be used during temporary abnormal frequency disturbances where the frequency is within the trip settings of frequency ride through to adjust the active power until frequency returns to within the deadband.

The image below shows the default setting following IEEE1547-2018.



Example:

If the cutomer wants to set up dead band values to IEEE1547. The procedure via the web-based GUI is shown below.

- Write " 0.036 " to Over-Freq Deadband
- Write " 0.036 " to Under-Freq Deadband
- Write " 0.05 " to Over-Freq Change ratio
- Write " 0.05 " to Under-Freq Change ratio
- Write " 5.00 " to Response Time
- Click the little box on the top left corner of the configuration window to enable Freq-Droop
- Click Save button to apply the settings to local inverter

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

Register	Sunpec Model DID	Size	Name	Description	Unit	Min	Max	Default Value
42223	711 - DER Frequency Droop	1	ENA	FreqDroop - Enable Flag		0	1	0
42245	711 - DER Frequency Droop	2	DB_OF	Freq Droop - Over-Frequency Deadband	Hz	0.017	1	0
42247	711 - DER Frequency Droop	2	DB_UF	Freq Droop - Under-Frequency Deadband	Hz	0.017	1	0
42249	711 - DER Frequency Droop	1	K_OF	Freq Droop - Over-Frequency Change Ratio	Hz	0.02	0.05	0
42250	711 - DER Frequency Droop	1	K_UF	Freq Droop - Under-Frequency Change Ratio	Hz	0.02	0.05	0
42251	711 - DER Frequency Droop	2	RSPTMS	Freq Droop - Open loop response time	s	0.2	10	0

To implement the same settings, the procedure is shown below.

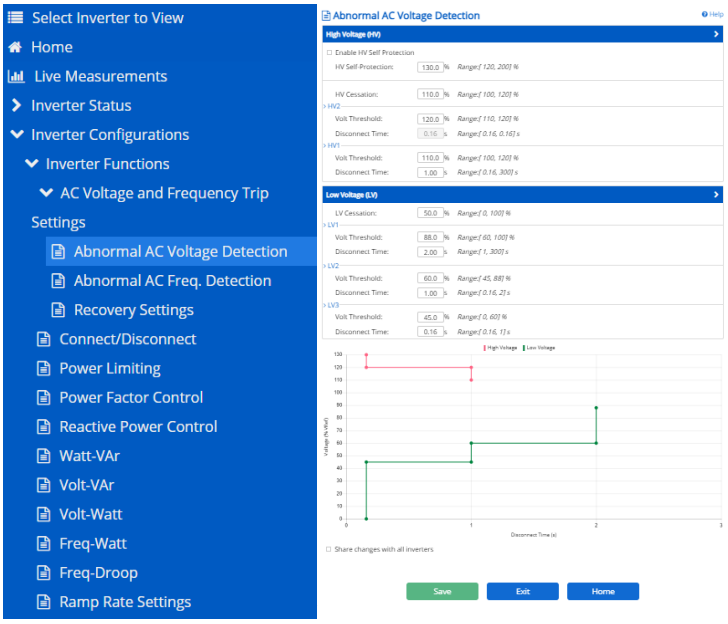
- Write “ 0.036 ” to register 42245 for Over-Freq Deadband
- Write “ 0.036 ” to register 42247 for Under-Freq Deadband
- Write “ 0.05 ” to register 42249 for Over-Freq Change Ratio
- Write “ 0.05 ” to register 42249 for Under-Freq Change Ratio
- Write “ 5.00 ” to register 42251 for Response Time
- Write “ 1 ” to register 42223 to Enable Freq-droop

12 Voltage Ride Through

This function allows inverter to response to low and high voltage transients that are outside the normal operation range of the electric gird. The HV Self Protection parameter for Self-Protection Over Voltage (SPOV) is available for XGI 1500-166 series (DSP firmware version 3.9.0+) and XGI 1500-250 series (DSP firmware version 7.3.0+). This can be enabled and it's response behavior can be configured to:

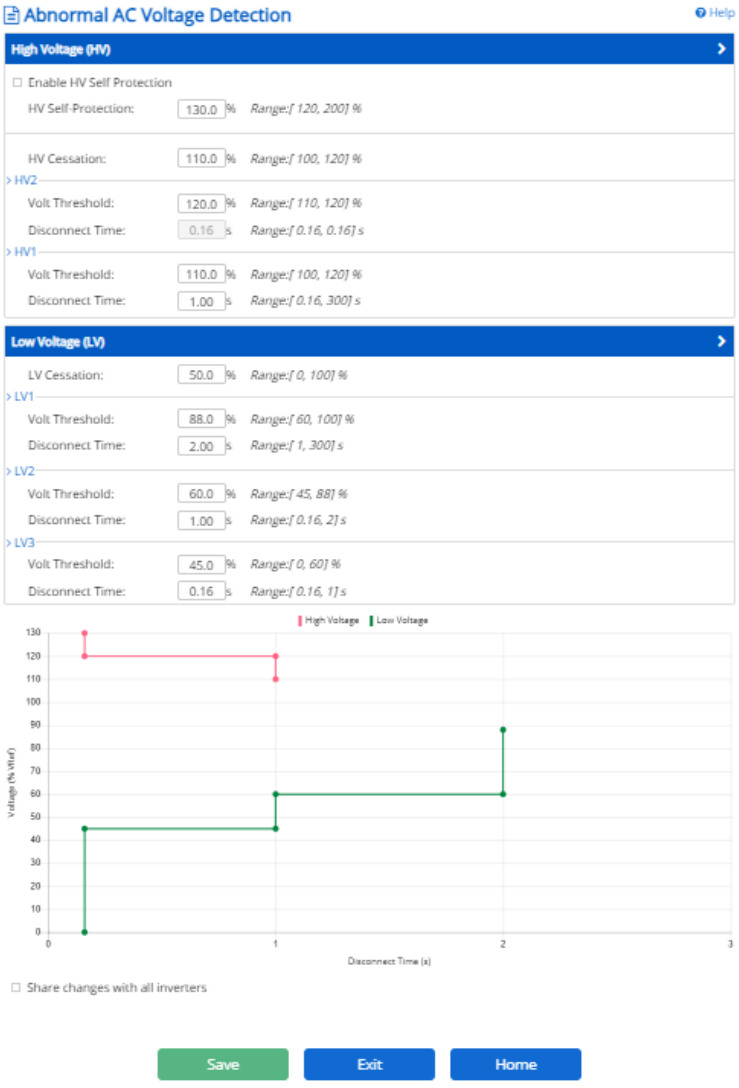
Name	Default	Setting Range
SPOV_VOLT_PCT	130%	120-200%
SPOV Trip Time	1ms	Fixed

If not enabled, the inverter will still trip to OV beyond 1.4 within 2-3ms. The image below shows the default setting of abnormal voltage trip settings. The default setting follows IEEE1547-2018 and the function is always enabled.



Example:

If the cutomer wants to change to Rule 21 instead of IEEE1547. The procedure via the web-based GUI is shown below.



- Write “ 130 ” to HV Self Protection
- Write “ 110 ” to HV Cessation
- Write “ 120 ” to HV2 Volt Threshold
- Write “ 110 ” to HV1 Volt Threshold
- Write “ 13.0 ” to HV1 Disconnect Time
- Write “ 88 ” to LV1 Volt Threshold
- Write “ 21.0 ” to LV1 Disconnect Time
- Write “ 70 ” to LV2 Volt Threshold
- Write “ 11.0 ” to LV2 Disconnect Time
- Write “ 50 ” to LV3 Volt Threshold
- Write “ 1.5 ” to LV3 Disconnect Time
- Click the little box on the top left corner of the configuration window to enable “SPOV”
- Click Save button to apply the settings to local inverter

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

Address		SunSpec Model	Name	Description	Type	Units	R/W	Setting Range (unscaled)	Default Value (unscaled)
42319	A54F	64190 - Solectria Variables	SPOV_ENA	Self Protection Over-Voltage enable	uint16	-		0/1	0
42320	A550	64190 - Solectria Variables	SPOV_VOLT_PCT	Self Protection Over-Voltage trip limit	float32	%V		120.0-200.0	130.0
40393	9DC9	130 - HVRTD	Tms2	Point 2 must disconnect duration (set as HV2)	uint16	Secs	RW	16	0

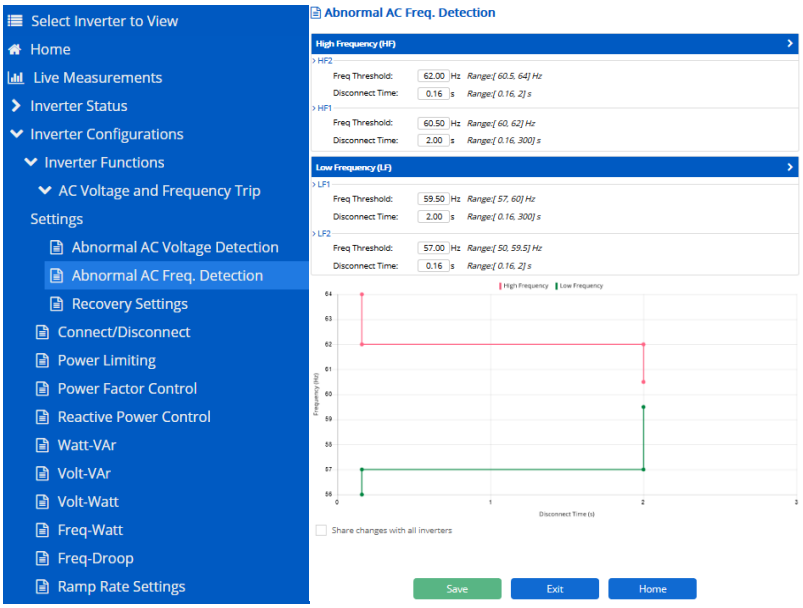
40397	9DCD	130 - HVRTD	Tms4	Point 4 must disconnect duration (set as HV1)	uint16	Secs	RW	16-1300	0
40398	9DCE	130 - HVRTD	V4	Point 4 must disconnect voltage (set as HV1)	uint16	% Vref	RW	1000-1200	1100
41208	A0F8	140 - HVRTX	V2	HVRT Momentary Cessation	uint16	% VRef	RW	1000-1200	1100
40331	9D8B	129 - LVRTD	Tms2	Point 2 must disconnect duration (set as LV3)	uint16	Secs	RW	16-150	16
40332	9D8C	129 - LVRTD	V2	Point 2 must disconnect voltage (set as LV3)	uint16	% Vref	RW	100-1000	450
40335	9D8F	129 - LVRTD	Tms4	Point 4 must disconnect duration (set as LV2)	uint16	Secs	RW	16-1100	100
40336	9D90	129 - LVRTD	V4	Point 4 must disconnect voltage (set as LV2)	uint16	% Vref	RW	100-1000	600
40339	9D93	129 - LVRTD	Tms6	Point 6 must disconnect duration (set as LV1)	uint16	Secs	RW	16-2100	200
40340	9D94	129 - LVRTD	V6	Point 6 must disconnect voltage (set as LV1)	uint16	% Vref	RW	100-1000	880
41146	A0BA	139 - LVRTX	V2	LVRT Momentary Cessation	uint16	% VRef	RW	0-1000	500

- Write “ 1 ” to register 42319 to Enable “SPOV”
- Write “ 130.0” to register 42320 for “SPOV” trip limit
- Write “ 16 ” to register 40393 for HV2 Disconnect Time
- Write “ 1200 ” to register 40394 for HV2 Volt Threshold
- Write “ 1300 ” to register 40397 for HV1 Disconnect Time
- Write “ 1100 ” to register 40398 for HV1 Volt Threshold
- Write “ 150 ” to register 40331 for LV3 Disconnect Time
- Write “ 500 ” to register 40332 for LV3 Volt Threshold
- Write “ 1100 ” to register 40335 for LV2 Disconnect Time
- Write “ 700 ” to register 40336 for LV2 Volt Threshold
- Write “ 2100 ” to register 40339 for LV1 Disconnect Time
- Write “ 880 ” to register 40340 for LV1 Volt Threshold

13 Frequency Ride Through

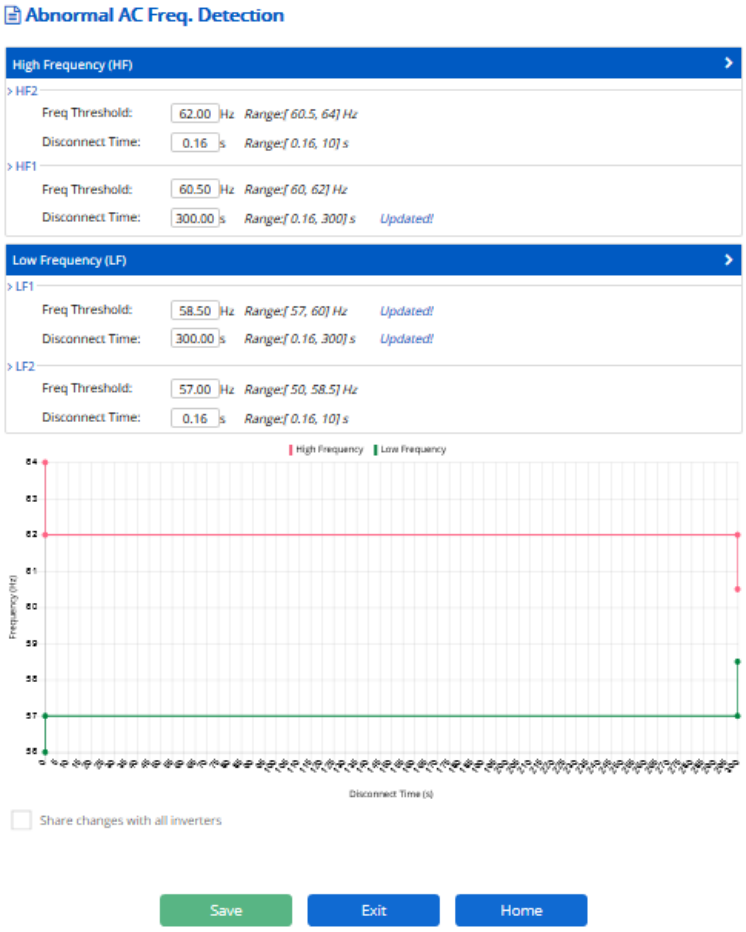
The feature allows inverter to response to low and high frequency excursions that are outside the normal operation range of electric grid.

The image below shows the default setting of abnormal frequency trip settings. The default setting follows IEEE1547-2018 and this feature is always enabled.



Example:

If the cutomer wants to change to Rule 21 instead of IEEE1547. The procedure via web-based GUI is shown below.



- Write “ 62.0 ” to HF2 Freq Threshold
- Write “ 0.16 ” to HF2 Disconnect Time
- Write “ 60.5 ” to HF1 Freq Threshold
- Write “ 300.00 ” to HF1 Disconnect Time
- Write “ 58.5 ” to LF1 Freq Threshold
- Write “ 300.00 ” to LF1 Disconnect Time
- Write “ 57.00 ” to LF2 Freq Threshold
- Write “ 0.16 ” to LF2 Disconnect Time
- Click Save button to apply the settings to local inverter

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

Register	Sunspec Model DID	Sunspec Offset	Name	Description	Unit	Min	Max	Default Value
40517	136	15	SSPEC_136_TMS2	Over Frequency Trip Time 2 (Very High)	s	16	200	16
40518	136	16	SSPEC_136_HZ2	Over Frequency Magnitude 2 (Very High)	Hz	6050	6400	6200
40521	136	19	SSPEC_136_TMS4	Over Frequency Trip Time 1 (High)	s	16	30000	200
40522	136	20	SSPEC_136_HZ4	Over Frequency Magnitude 1 (High)	Hz	6000	6200	6050
40455	135	15	SSPEC_135_TMS2	Under Frequency Trip Time 2 (Very Low)	s	16	200	16
40456	135	16	SSPEC_135_HZ2	Under Frequency Magnitude 2 (Very Low)	Hz	5000	5950	5700
40459	135	19	SSPEC_135_TMS4	Under Frequency Trip Time 1 (Low)	s	16	30000	200
40460	135	20	SSPEC_135_HZ4	Under Frequency Magnitude 1 (Low)	Hz	5700	6000	5950

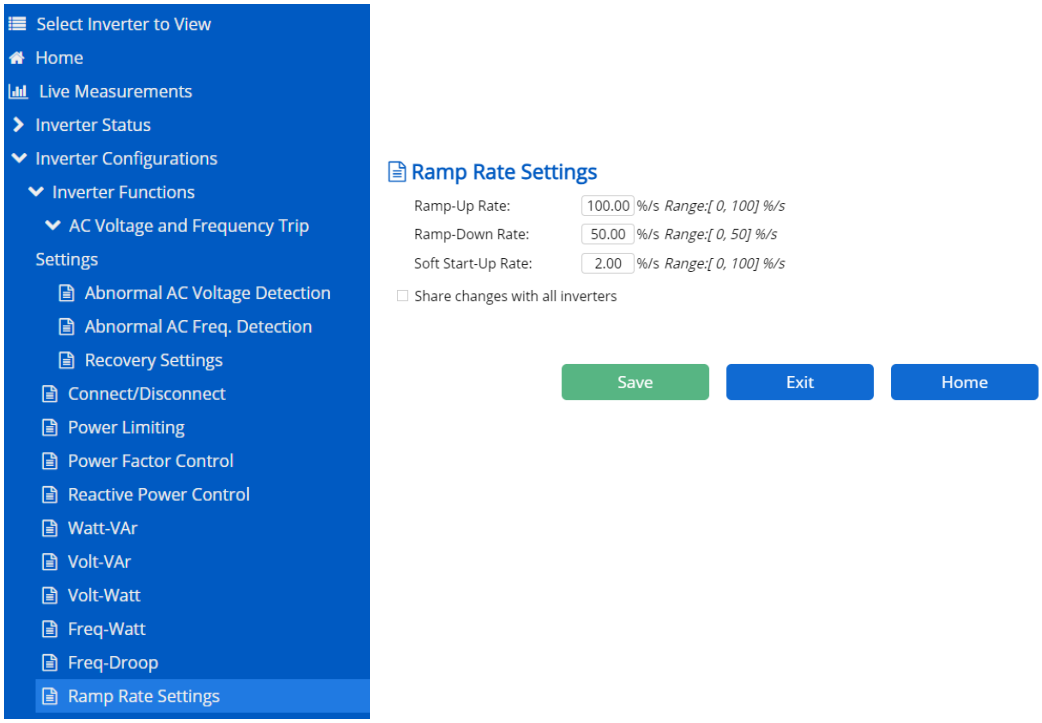
To implement the same curve, the procedure is shown below.

- Write “ 16 ” to register 40517 for HF2 Disconnect Time
- Write “ 6200 ” to register 40518 for HF2 Freq Threshold
- Write “ 30000 ” to register 40521 for HF1 Disconnect Time
- Write “ 6050 ” to register 40522 for HF1 Freq Threshold
- Write “ 16 ” to register 40455 for LF2 Disconnect Time
- Write “ 5700 ” to register 40456 for LF2 Freq Threshold
- Write “ 30000 ” to register 40459 for LF1 Disconnect Time
- Write “ 5850 ” to register 40460 for LF1 Freq Threshold

14 Ramp Rate Settings

The feature allows the inverter to establish ramp-up / ramp-down rates for solar systems. It helps smooth transitions from one output level to another output level. Although a single system might not impact the electric grid through a single sharp transition, aggregated systems responding to a specific event could cause significant rapid jumps in overall output if they do not ramp to the new power level.

The image below shows the default setting of Ramp Rate functions. The default setting for normal ramp up rate is 100% and ramp down rate is 50% of rated current per second as well as 2% of rated current per second for inverter soft-start ramp rate.



Example:

If the cutomer wants to implement a much slower ramp up / ramp down rate (1% of rated current per second) during normal operation, and the customer also wants to have a really fast recover during soft-start (100% of rated current per second). The procedure via web-based GUI is shown below.

- Write “ 1.0 ” to ramp up rate
- Write “ 1.0 ” to ramp down rate
- Write “ 100.0 ” to soft start rate
- Click Save button to apply the settings to local inverter

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

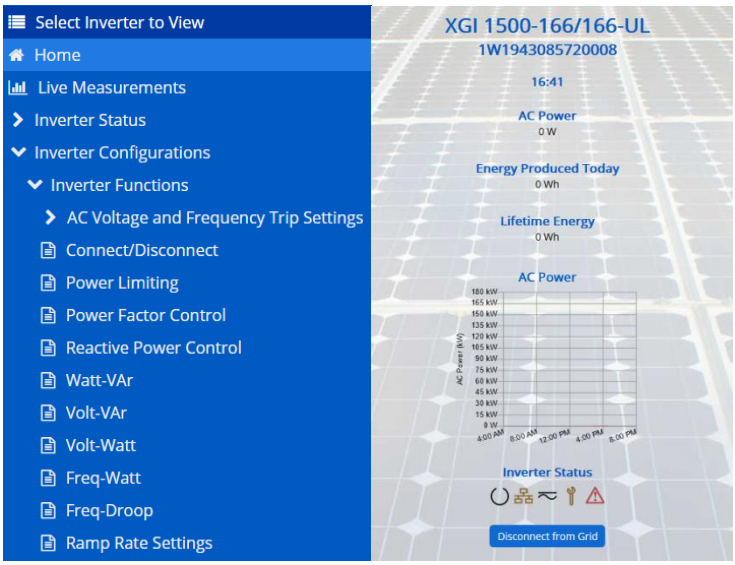
Address		SunSpec Model	Name	Description	Type	Units	R/W	Setting Range (unscaled)	Default Value (unscaled)
41256	A128	145 - Extended Setting	NomRmpUpRte	Normal Ramp up rate as a percentage of max current	uint16	Pct	RW	0-10000	10000
41260	A12C	145 - Extended Setting	ConnRmpUpRte	Soft Connect ramp up rate as a percentage of max current	uint16	Pct	RW	0-10000	200
41257	A129	145 - Extended Setting	NomRmpDnRte	Ramp down rate as a percentage of max current	uint16	Pct	RW	0-5000	5000

To implement the same setting, the procedure is shown below.

- Write “ 100 ” to register 41256 for Normal Ramp Up Rate
- Write “ 100 ” to register 41257 for Ramp Down Rate
- Write “ 10000 ” to register 41260 for Soft Start-up Rate

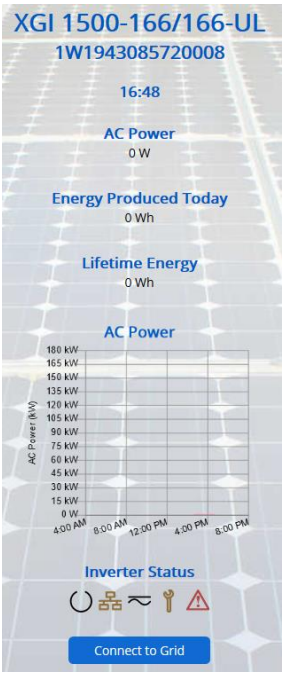
15 Power Enable/Disable

The feature allows inverter to connect to the grid and produce power (Enabled) or disconnect from grid (Disabled). The default setting for this feature is enabled.



Example:

If the cutomer wants to disconnect inverter from the grid, click “Disconnect from Grid” button in the home page via web-based GUI. After that, inverter will stop producing power and open the contactor. The button will change to “Connect to Grid”.



The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

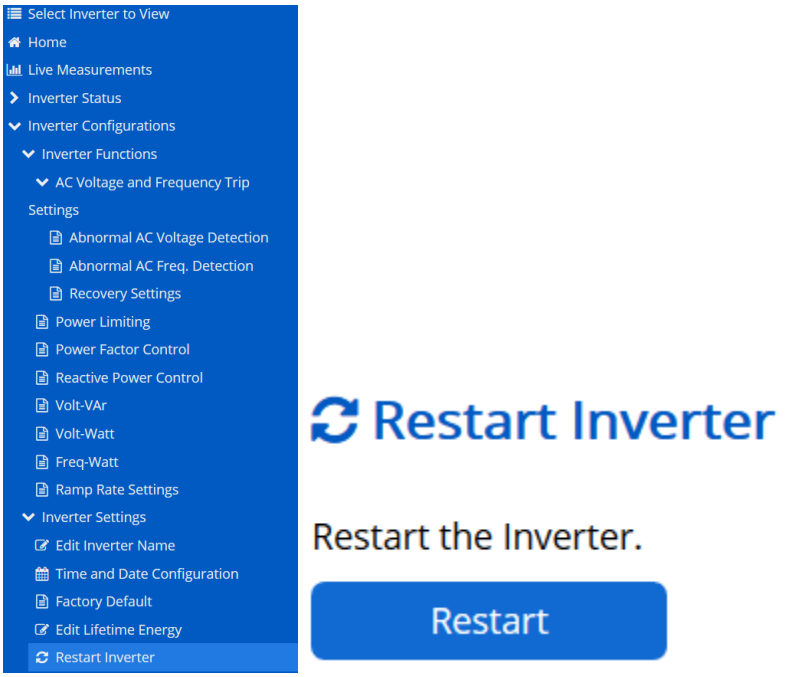
Register	Sunspec Model DID	Sunspec Offset	Name	Description	Unit	Min	Max	Default Value
40294	123	4	SSPEC_123_CONN	Connection control for connect disconnect		0	1	1

To implement the same step, the procedure is shown below.

- Write “ 0 ” to register 40294 for disconnecting from the grid.

16 Inverter Restart

This feature allows inverter control MCU to reset. It will clear all the faults and restart the inverter.



Example:

If cutomer wants to reset and restart inverter, click “Restart” button via web-based GUI. After that, inverter will stop producing power, reset MCU and restart itself.

The alternative method is to use software which supports Modbus TCP/IP. The register address is shown below.

Register	Sunspec Model DID	Sunspec Offset	Name	Description	Unit	Min	Max	Default Value
40921	64190	51	SSPEC_64190_RESET_DSP	DSP Reset command. Shutdown the inverter and reset the DSP.		577	577	0

To implement the same step, the procedure is shown below.

- Write “ 577 ” to register 40921 for restarting inverter.

17.4 Model 113 – Inverter (Three-Phase) FLOAT

Table 17.9 Model 113

Address	Size	Name	Value	Type	Units	Scale factor	R/W	Description
40122	1	ID	113	uint16	-	-	R	Model number
40123	1	L	62	uint16	-	-	R	Model length
40124	2	A	-	float32	A	-	R	AC Current
40126	2	AphA	-	float32	A	-	R	Phase A current
40128	2	AphB	-	float32	A	-	R	Phase B current
40130	2	AphC	-	float32	A	-	R	Phase C current
40132	2	PPVphAB	-	float32	V	-	R	Phase voltage AB
40134	2	PPVphBC	-	float32	V	-	R	Phase voltage BC
40136	2	PPVphCA	-	float32	V	-	R	Phase voltage CA
40138	2	PhVphA	-	float32	V	-	R	Phase voltage AN
40140	2	PhVphB	-	float32	V	-	R	Phase voltage BN
40142	2	PhVphC	-	float32	V	-	R	Phase voltage CN
40144	2	W	-	float32	W	-	R	AC Power
40146	2	Hz	-	float32	Hz	-	R	Line Frequency
40148	2	VA	-	float32	VA	-	R	AC Apparent Power
40150	2	VAr	-	float32	var	-	R	AC Reactive Power
40152	2	PF	-	float32	Pct	-	R	AC Power Factor
40154	2	WH	-	float32	Wh	-	R	AC Energy
40158	2	DCV	-	float32	V	-	R	DC voltage
40162	2	TmpCab	-	float32	C	-	R	Cabinet Temperature
40164	2	TmpSnk	-	float32	C	-	R	Internal Temperature
40168	2	TmpOt	-	float32	C	-	R	IMI temperature
40170	1	St	-	enum16	-	-	R	Operating state, see St Enumerated
40171	1	StVnd	-	enum16	-	-	R	Vender state, see StVnd Enumerated
40172	2	Evt1	-	bitfield32	-	-	R	Event, see Evt1 Bitfield
40174	2	Reserved	-	-	-	-	R	Reserved
40176	2	EvtVnd1	-	bitfield32	-	-	R	Vendor Event 1, see EvtVnd1 Bitfield
40178	2	EvtVnd2	-	bitfield32	-	-	R	Vendor Event 2, see EvtVnd2 Bitfield
40180	2	EvtVnd3	-	bitfield32	-	-	R	Vendor Event 3, see EvtVnd3 Bitfield
40182	2	Reserved	-	-	-	-	R	Reserved

17.4.1 St Enumerated

Table 17.10 St Enumerated

Value	Description
3	Starting
4	MPPT Mode
5	Throttled
6	Shutting Down
7	Fault
8	Standby

17.4.2 StVnd Enumerated

Table 17.11 StVnd Enumerated

Value	Description
1	Initializing
2	Recovery
3	Normal Operation with Factory Configuration
4	Normal Operation with Manufacturing Configuration
5	Setup of Custom Configuration
6	Normal Operation with Custom Configuration
7	Normal Operation with Communication Fault
8	Administrator Configuration
9	Software Update
10	Normal Shutdown

17.4.3 Evt1 Bitfield

Table 17.12 Evt1 Bitfield

Bit	Description
0	Ground Fault
1	DC Over Voltage
2	AC Disconnect
4	Grid Shutdown
6	Manual Shutdown
7	Over Temp
8	Over Frequency
9	Under Frequency
10	AC Over Voltage
11	AC Under Voltage
14	Memory loss (program or data Flash/ RAM memory corruption) or internal communication error
15	Hardware Test Failure

17.4.4 EvtVnd1 Bitfield

Table 17.13 Evt1Vnd Bitfield

Code	Bit	Description
CRIT-1	0	Software Parameter Load Failure
CRIT-2	1	Internal Communication 1 Failure
CRIT-3	2	Internal Communication 2 Failure
CRIT-4	3	Arc Fault Detected
CRIT-5	4	AC Contactor Failure
CRIT-6	5	Over Temperature
CRIT-7	6	Excessive Leakage Current
CRIT-8	7	Low Isolation Resistance
CRIT-9	8	Internal Hardware Failure
CRIT-10	9	Ground Fault Detection Failure
CRIT-11	10	Self-Check Failure
CRIT-12	11	Self-Check Startup Failure

17.4.5 EvtVnd2 Bitfield

Table 17.14 Evt2Vnd Bitfield

Code	Bit	Description
WARN-1	0	Over Voltage Current
WARN-2	1	Phase lock loop failure
WARN-3	2	Island Detected
WARN-4	3	Open Phase Detected
WARN-5	4	Low Frequency 1 (LF1)
WARN-6	5	Low Frequency 2 (LF2)
WARN-7	6	High Frequency 1 (HF1)
WARN-8	7	High Frequency 2 (HF2)
WARN-9	8	Low Voltage 1 (LV1)
WARN-10	9	Low Voltage 2 (LV2)
WARN-11	10	Low Voltage 3 (LV3)
WARN-12	11	High Voltage 1 (HV1)
WARN-13	12	High Voltage 2 (HV2)
WARN-24	23	Communications System Fault
WARN-25	24	Communications 1 Fault
WARN-26	25	Communications 2 Fault
WARN-27	26	Communications 3 Fault
WARN-28	27	Network Fault
WARN-29	28	Software Update Fault
WARN-30	29	Unauthorized Network Access Fault
WARN-31	30	Invalid Configuration Request

17.4.6 EvtVnd3 Bitfield

Table 2.4.6 - Evt3Vnd Bitfield

Code	Bit	Description
INFO-1	0	Power Derating – Temperature
INFO-2	1	Power Derating – Customer Command
INFO-3	2	Remote Shutdown Command
INFO-4	3	Shutdown Command from AC Switch
INFO-5	4	Shutdown Command from Digital Input

17.5 Model 120 – Nameplate

Table 17.15 Model 120

Address	Size	Name	Value	Type	Units	Scale Factor	R/W	Description
40184	1	ID	120	uint16	-	-	R	Model number
40185	1	L	26	uint16	-	-	R	Model length
40186	1	DERTyp	4	enum16	-	-	R	Type of DER device, see DERTyp Enumerated
40187	1	WRtg	-	uint16	W	WRtg_SF	R	Continuous output power capability of the inverter
40188	1	WRtg_SF	3	sunssf	-	-	R	Scale factor – output power rating
40189	1	VARtg	-	uint16	VA	VARtg_SF	R	Continuous output Volt-Ampere capability of the inverter
40190	1	VARtg_SF	3	sunssf	-	-	R	Scale factor – output Volt-Ampere rating
40191	1	VArRtgQ1	-	int16	var	VArRtg_SF	R	Continuous VAR capability of the inverter in quadrant 1
40194	1	VArRtgQ4	-	int16	var	VArRtg_SF	R	Continuous VAR capability of the inverter in quadrant 4
40195	1	VArRtg_SF	3	sunssf	-	-	R	Scale factor for VAR rating
40196	1	ARtg	-	uint16	A	ARtg_SF	R	Continuous output current capability of the inverter
40197	1	ARtg_SF	-1	sunssf	-	-	R	Scale factor – output current rating
40198	1	PFRtgQ1	-	int16	cos()	PFRtg_SF	R	Minimum power factor capability of the inverter in quadrant 1
40201	1	PFRtgQ4	-	int16	cos()	PFRtg_SF	R	Minimum power factor capability of the inverter in quadrant 4
40201	1	PFRtg_SF	-2	int16	-	-	R	Scale factor for PF

17.5.1 DERTyp Enumerated

Table 17.16 DERTyp Enumerated

Value	Description
4	Photovoltaic
82	Photovoltaic Storage

17.6 Model 121 – Basic Settings

Table 17.17 Model 121

Address	Size	Name	Value	Type	Units	Scale Factor	R/W	Description
40212	1	ID	121	uint16	-	-	R	Model number
40213	1	L	30	uint16	-	-	R	Model length
40214	1	WMax	-	uint16	W	WMax_SF	R	Setting for maximum power output
40215	1	VRef	-	uint16	V	VRef_SF	R	Voltage from PCC to inverter
40216	1	VRefOfs	0	uint16	V	VRefOfs_SF	RW	Address from PCC to inverter
40217	2	Reserved	-	-	-	-	R	Reserved
40219	1	VAMax	-	uint16	VA	VAMax_SF	R	Setpoint for maximum apparent power
40220	1	VArMaxQ1	-	int16	var	VArMax_SF	R	Setting for maximum reactive power in quadrant 1
40223	1	VArMaxQ4	-	int16	var	VArMax_SF	R	Setting for maximum reactive power in quadrant 4
40225	1	PFMinQ1	-80	int16		PFMin_SF	R	Setpoint for minimum power factor in quadrant 1
40226	2	Reserved	-	-	-	-	R	Reserved
40228	1	PFMinQ4	80	int16		PFMin_SF	R	Setpoint for minimum power factor in quadrant 4
40229	1	Reserved	-	-	-	-	R	Reserved
40230	1	ClcTotVA	1	enum16	-	-	R	Calculation method for apparent power, see ClcTotVA Enumerated
40231	1	Reserved	-	-	-	-	R	Reserved
40232	1	ECPNomHz	-	uint16	Hz	ECPNomHz_SF	R	Setpoint for nominal frequency at the PCC
40233	1	Reserved	-	-	-	-	R	Reserved
40234	1	WMax_SF	3	sunssf	-	-	R	Scale factor – real power
40235	1	VRef_SF	0	sunssf	-	-	R	Scale factor – voltage at the PCC
40236	1	VRefOfs_SF	-	sunssf	-	-	R	Scale factor – Address voltage
40237	1	Reserved	-	-	-	-	R	Reserved
40238	1	VAMax_SF	3	sunssf	-	-	R	Scale factor – apparent power

40239	1	VArMax_SF	3	sunssf	-	-	R	Scale factor – reactive power
40240	1	Reserved	-	-	-	-	R	Reserved
40241	1	PFMin_SF	-2	sunssf	-	-	R	Scale factor – maximum power factor
40242	1	Reserved	-	-	-	-	R	Reserved
40243	1	ECPNomHz_SF	-2	sunssf	-	-	R	Scale factor – nominal frequency

17.6.1 ClcTotVA Enumerated

Table 17.18 ClcTotVA Enumerated

Value	Description
1	Vector
2	Arithmetic

17.7 Model 122 – Measurement Status

Table 17.19 Model 122

Address	Size	Name	Value	Type	Units	Scale Factor	R/W	Description

40524	1	Hz5	6050	uint16	Hz	Hz_SF	RW	Point 5 must disconnect - frequency
40563	1	ReadOnly	0	enum16	-	-	R	Indicates if curve is read-only or can be modified, see ReadOnly Enumerated

17.12.1 ModEna Bitfield

Table 17.35 ModEna Bitfield

Bit	Description
0	Enabled

17.12.2 ReadOnly Enumerated

Table 17.33 ReadOnly Enumerated

Value	Description
0	READWRITE
1	READONLY

17.13 Model 16 – Simple IP Network (eth1)

Table 17.36 Model 16

Address	Size	Name	Value	Type	Units	Scale Factor	R/W	Description
40654	1	ID	16	uint16	-	-	R	Model number
40655	1	L	52	uint16	-	-	R	Model length
40656	4	Nam	eth1	string	-	-	R	Interface name
40660	1	Cfg	-	enum16	-	-	R	Force IPv4 configuration method, see Cfg Enumerated
40661	1	Ctl	3	enum16	-	-	R	Bitmask value configuration, see Ctl Enumerated
40662	8	Addr	-	string	-	-	R	IP address
40670	8	Msk	-	string	-	-	R	Netmask
40678	8	Gw	-	string	-	-	R	Gateway IP address
40686	16	Reserved	-	-	-	-	R	Reserved
40702	4	MAC	-	uint64	-	-	R	IEEE MAC address
40706	1	LnkCtl	3	bitfield16	-	-	RW	Link control flags, see LnkCtl Bitfield

17.13.1 Cfg Enumerated

Table 17.37 Enumerated

Value	Description
0	Static IP Address is Assigned
1	DHCP Used to Acquire IP Address

17.13.2 Ctl Enumerated

Table 17.38 Ctl Enumerated

Value	Description
0	Enable DNS
1	Enable NTP

17.13.3 LnkCtl Bitfield

Table 17.39 ModEna Bitfield

Bit	Description
0	Auto-Negotiate
1	Full Duplex

17.14 Model 16001 – Simple IP Network (eth2)

Table 17.40 Model 16001

Address	Size	Name	Value	Type	Units	Scale Factor	R/W	Description
40708	1	ID	16	uint16	-	-	R	Model number
40709	1	L	52	uint16	-	-	R	Model length
40710	4	Nam	eth2	string	-	-	R	Interface name
40714	1	Cfg	-	enum16	-	-	R	Force IPv4 configuration method, see Cfg Enumerated
40715	1	Ctl	3	enum16	-	-	R	Bitmask value configuration, see Ctl Enumerated
40716	8	Addr	-	string	-	-	R	IP address
40724	8	Msk	-	string	-	-	R	Netmask
40732	8	Gw	-	string	-	-	R	Gateway IP address

17.17 Model 64190 – Solectria Variables

Table 17.52 Model 64190

Address	Size	Name	Value	Type	Units	Scale Factor	R/W	Description
40870	1	ID	64190	uint16	-	-	R	Model number
40871	1	L	49	uint16	-	-	R	Model length
40872	1	AFRT	-	uint16	S	AFRT_SF	RW	Abnormal recovery time
40873	1	AFRT_SF	0	sunssf	-	-	R	Scale factor – abnormal recovery time
40874	2	WH	-	float32	Wh	-	R	Today's energy production
40876	16	InvName	-	string	-	-	RW	Inverter name
40892	1	Password	-	string	-	-	W	Password
40893	2	ClrEvt1	-	bitfield32	-	-	W	Clears Evt1 (40110, 40176), see Evt1 Bitfield
40895	2	ClrEvtVnd1	-	bitfield32	-	-	W	Clears EvtVnd1 (40111, 40177), see EvtVnd1 Bitfield
40897	2	ClrEvtVnd2	-	bitfield32	-	-	W	Clears EvtVnd2 (40112, 40178), see EvtVnd2 Bitfield
40899	2	ClrEvtVnd3	-	bitfield32	-	-	W	Clears EvtVnd3 (40113, 40179), see EvtVnd3 Bitfield
40901	2	Reserved	-	-	-	-	R	Reserved
40903	1	LedStat	-	bitfield16	-	-	R	LED status
40904	1	InputZone	-	uint16	-	-	RW	Input zone number configuration
40905	11	Reserved	-	-	-	-	R	Reserved
40919	1	AFRWT	-	uint16	S	AFRWT_SF	RW	Abnormal recovery wait time
40920	1	VDC_Rating	-	uint16	-	-	R	Rated DC Voltage rating

17.17.1 Evt1 Bitfield

Table 17.53 Evt1 Bitfield

Bit	Description
0	Ground Fault
1	DC Over Voltage
2	AC Disconnect
4	Grid Shutdown
6	Manual Shutdown
7	Over Temp
8	Over Frequency
9	Under Frequency
10	AC Over Voltage
11	AC Under Voltage
14	Memory loss (program or data Flash/ RAM memory corruption) or internal communication error
15	Hardware Test Failure

17.17.2 EvtVnd1 Bitfield

Table 17.54 Evt1Vnd Bitfield

Code	Bit	Description
CRIT-1	0	Software Parameter Load Failure
CRIT-2	1	Internal Communication 1 Failure
CRIT-3	2	Internal Communication 2 Failure
CRIT-4	3	Arc Fault Detected
CRIT-5	4	AC Contactor Failure
CRIT-6	5	Over Temperature
CRIT-7	6	Excessive Leakage Current
CRIT-8	7	Low Isolation Resistance
CRIT-9	8	Internal Hardware Failure
CRIT-10	9	Ground Fault Detection Failure
CRIT-11	10	Self-Check Failure
CRIT-12	11	Self-Check Startup Failure
CRIT-13	12	Hardward self test failure

17.17.3 EvtVnd2 Bitfield

Table 17.55 Evt2Vnd Bitfield

Code	Bit	Description
WARN-1	0	Over Voltage Current
WARN-2	1	Phase lock loop failure
WARN-3	2	Island Detected
WARN-4	3	Open Phase Detected
WARN-5	4	Low Frequency 1 (LF1)
WARN-6	5	Low Frequency 2 (LF2)
WARN-7	6	High Frequency 1 (HF1)

WARN-8	7	High Frequency 2 (HF2)
WARN-9	8	Low Voltage 1 (LV1)
WARN-10	9	Low Voltage 2 (LV2)
WARN-11	10	Low Voltage 3 (LV3)
WARN-12	11	High Voltage 1 (HV1)
WARN-13	12	High Voltage 2 (HV2)
WARN-24	23	Communications System Fault
WARN-25	24	Communications 1 Fault
WARN-26	25	Communications 2 Fault
WARN-27	26	Communications 3 Fault
WARN-28	27	Network Fault
WARN-29	28	Software Update Fault
WARN-30	29	Unauthorized Network Access Fault
WARN-31	30	Invalid Configuration Request

17.17.4 EvtVnd3 Bitfield

Table 17.56 Evt3Vnd Bitfield

Code	Bit	Description
INFO-1	0	Power Derating – Temperature
INFO-2	1	Power Derating – Customer Command
INFO-3	2	Remote Shutdown Command
INFO-4	3	Shutdown Command from AC Switch
INFO-5	4	Shutdown Command from Digital Input
INFO-6	5	External Fan Damaged
INFO-7	6	Internal Fan Damaged

17.17.5 LedStat Bitfield

Table 17.57 LedStat Bitfield

Bit	Description
0	Inverter Warning/Fault
1	Inverter Service
2	Inverter AC Power Generation
3	Inverter Network Status
4	System Ready

17.17.6 stStrtArcTest Enumerated

Table 17.58 stStrtArcTest Enumerated

Value	Description
0	Off
1	Start
2	Running

17.17.7 stStrtIRTest Enumerated

Table 17.59 stStrtIRTest Enumerated

Value	Description
0	Off
1	Start
2	Running

17.17.8 stStrtIMITest Enumerated

Table 17.60 stStrtIMITest Enumerated

Value	Description
0	Off
1	Start
2	Running
